

FAQs on population mortality before and during the COVID-19 pandemic in Yemen study

What is the aim of the study?

The aim of this study is to inform the response by humanitarian actors, government stakeholders and civil society in Yemen to the ongoing crisis and the COVID-19 pandemic. This study is expected to generate evidence on the extent to which mortality among children and adults has been changing in Yemen over time.

Why have I been asked to take part?

You have been invited to participate in the study by one of your friends, relatives or colleagues, as you have a Yemeni background, reside outside Yemen, and can complete the survey on behalf of your close family. We seek to talk to members from the global Yemeni Diaspora and collect information on living and deceased members of their families in Yemen and abroad. We intend to have a range of Yemeni participants from different countries outside of Yemen.

Do I have to take part?

It is your choice to join this study. The survey asks you to confirm that you understand what is involved in participating in the study and confirms that we will not ask you for any information that could identify you. Once you have started the survey, you may stop at any time.

What does it mean to participate?

Participation involves completing an online survey about your close family members (i.e. your parents, spouse, siblings, and nieces/nephews). The survey asks for information about each close family member (e.g. gender, age, whether they have died or not, and if so, where and by what means). The survey also includes some questions about the average socio-economic status of your closest family members who are still in Yemen.

After completing the questionnaire, you will also be asked to invite five people from your social network to complete the same survey. You can invite others within your family to take the survey, as long as they are not your children, siblings, parents, nephews, nieces, uncles or aunts or any of the above from your partner's family.

However, if possible, we would ask you also to share the survey with contacts outside your family with people who have not already participated in the survey. We recommend that you invite five people, but you do not have to.

Are there any risks or benefits for me in taking part in this study?

There is a risk that you may recall events that will make you sad or upset: if for any reason you prefer to stop answering the survey, you are, of course, free to do so. There are no real benefits for you from taking part in the study. Still, your information

will help raise awareness and advocate for Yemenis regarding the severity of the humanitarian situation and the impact of COVID-19 in Yemen. We hope this will both evidence and improve resource allocation decisions by humanitarian actors. It may also contribute to efforts to resolve the ongoing conflict.

Will my participation be anonymous?

Yes. During the survey will not ask you for any identifying information about yourself or your family members. We will not ask for names or addresses. The survey has been designed to ask for the minimum amount of information to achieve the aim of the study. No one (including members of the study team) will be able to identify you or any of your family members. We will ask you to forward the survey to others; however, this will also be done anonymously.

All data will be stored securely. Once the study is complete, we will publish the data so that others can replicate our analysis and verify our estimates. The published data will be completely anonymous.

How will study results be used?

Study results will be published in a study report and one or more scientific articles. They will also be presented to researchers and organisations assisting with the humanitarian response in Yemen. We will include a link to the final published report and any other published outputs on this website.
