

MODULE SPECIFICATION

Academic Year (student				
cohort covered by	2022-23			
specification)				
Module Code	2417			
Module Title	Design & Analysis of Epidemiological Studies			
Module Organiser(s)	Dr Christian Bottomley and Stefan Witek-McManus			
Faculty	Epidemiology & Population Health			
FHEQ Level	Level 7			
Credit Value	CATS: 15			
	ECTS: 7.5			
HECoS Code	101031 : 101335			
Term of Delivery	Term 2			
Mode of Delivery	For 2022-23 this module will be delivered by predominantly			
	face-to-face teaching modes.			
	Where specific teaching methods (lectures, seminars,			
	discussion groups) are noted in this module specification			
	these will be delivered by predominantly face-to-face			
	sessions. There will be a combination of live and interactive			
	activities (synchronous learning) as well as recorded or self-			
	directed study (asynchronous learning)			
	g,			
Mode of Study	Full-time			
Language of Study	English			
Pre-Requisites	An introductory statistics course.			
Accreditation by	None			
Professional Statutory				
and Regulatory Body				
Module Cap (indicative	75 (numbers may be capped due to limitations in facilities or			
number of students)	staffing)			
Target Audience	The module is intended for students who have attended			
	Term 1 modules in Epidemiology and in Statistics, and who			
	wish to understand more about the design and analysis of			
	epidemiological studies. It includes some review and			
	consolidation of Term 1 material.			
Module Description	The module covers both the design and statistical analysis of			
	epidemiological studies. It is designed for students who want			

	to improve their understanding of the methods used in public health research. The first half of the module is focussed on design aspects and key epidemiological concepts. In this part of the course, students learn the strength and weaknesses of the different designs and how to choose an appropriate sample size. They			
	are also introduced to the concepts of confounding and selection bias through the use of causal diagrams.			
	The second half of the module focusses on the use of regression models to adjust for confounding. The statistical concept of clustering is also introduced in this part of the course.			
	Students will have the opportunity to analyse data in a number of computer-based practical classes. However, the emphasis in these classes, and throughout the course, is on understanding epidemiological concepts rather than gaining statistical expertise.			
Duration	5 weeks at 2.5 days per week			
Timetabling slot	Slot C2			
Last Revised (e.g. year	August 2022			
changes approved)				

Programme(s)	Status	
This module is linked to the following programme(s)		
MSc Public Health for Development	Recommended	
MSc Control of Infectious Diseases	Recommended	
MSc Health Policy, Planning & Finance	Recommended	
MSc Nutrition for Global Health	Recommended	
MSc Public Health	Recommended	
MSc Public Health (Environment & Health)	Recommended	
MSc Public Health (Health Economics)	Recommended	
MSc Public Health (Health Promotion)	Recommended	
MSc Public Health (Health Services Research)	Recommended	
MSc Tropical Medicine & International Health	Recommended	

Module Aim and Intended Learning Outcomes

Overall aim of the module

The aim of the module is to equip students with the necessary skills to understand and appraise the design, analysis and interpretation of epidemiological studies.

Module Intended Learning Outcomes

Upon successful completion of the module a student will:

- 1. Be familiar with the main study designs used in epidemiological research, and understand their advantages and disadvantages.
- 2. Understand the concepts of confounding, statistical interaction and clustering.
- 3. Understand why statistical models are used in epidemiology.
- 4. Be able to interpret the output from a logistic regression model.
- 5. Be able to critically appraise the design, analysis and interpretation of studies conducted by other investigators, and communicate effectively with public health researchers.

Indicative Syllabus

Session Content

The module will cover the following topics:

- 1. Epidemiological study designs
- 2. Measures of disease
- 3. Sample size calculations
- 4. Selection bias
- 5. Confounding
- 6. Statistical interaction
- 7. Logistic and linear regression
- 8. Clustering
- 9. Paper critique

Teaching and Learning

Notional Learning Hours

Type of Learning Time	Number of Hours	Expressed as Percentage (%)
Contact time	37	25
Directed self-study	9	6
Self-directed learning	60	40
Assessment, review and revision	44	29
Total	150	100

Student contact time refers to the tutor-mediated time allocated to teaching, provision of guidance and feedback to students. This time includes activities that take place in face-to-face contexts such as lectures, seminars, demonstrations, tutorials, supervised laboratory workshops, practical classes, project supervision as well as where tutors are available for one-to-one discussions and interaction by email.

The division of notional learning hours listed above is indicative and is designed to inform students as to the relative split between interactive and self-directed study.

Teaching and Learning Strategy

The course material will be delivered though lectures, guided self-study and tutor-led practical sessions. The practical sessions are problem-based, with some involving pen and paper calculation or use of statistical software (primarily Stata but no previous Stata experience is expected). Students are encouraged to work in groups and will have the opportunity to present their work.

Assessment

Assessment Strategy

The assessment for this module has been designed to measure student learning against the module intended learning outcomes (ILOs) as listed above. Formative assessment methods may be used to measure students' progress. The grade for summative assessment only will go towards the overall award GPA.

The summative assessment will involve a written review of a paper from the public health literature. The student will answer a series of questions designed to test understanding of the study design and statistical methods used including potential sources of bias, interpretation of results, and strengths and weaknesses of the study.

The assessment for this module will be submitted online. Students are expected to complete the assessment during the last two weeks of the module (teaching weeks 4 and 5 of term 2).

Summative Assessment

Assessment Type	Assessment Length (i.e. Word Count, Length of	Weighting (%)	Intended Module Learning Outcomes
	presentation in minutes)		Tested
Coursework	1500 words	100%	All

Resitting assessment

Resits will accord with the LSHTM's <u>Resits Policy</u>. Resits will take the same form as described above but students will be given a different paper to review. The resit assessment is made available at the end of term 3. As with the original assessment, students are expected to complete the assessment within 2 weeks of receiving it.

Resources

Indicative reading list

Essential Medical Statistics, by Betty Kirkwood and Jonathan Sterne
Statistics for Epidemiology, by Nicholas Jewell
Field Trials of Health Interventions, Edited by Peter Smith, Richard Morrow and David Ross

Teaching for Disabilities and Learning Differences

The module-specific site on Moodle gives students access to lecture notes and copies of the slides used during the lecture. Where appropriate, lectures are recorded and made available on Moodle. All materials posted on Moodle, including computer-based sessions, have been made accessible where possible.

LSHTM Moodle is accessible to the widest possible audience, regardless of specific needs or disabilities. More detail can be found in the <u>Moodle Accessibility Statement</u> which can also be found within the footer of the Moodle pages. All students have access to "SensusAccess" software which allows conversion of files into alternative formats.

Student Support Services can arrange learning or assessment adjustments for students where needed. Details and how to request support can be found on the <u>LSHTM Disability Support pages</u>.
